PERFORMANCE ANALYSIS REPORT

🏛️ Marketing Funnel & Conversion Performance Report

PREPARED BY

Oshea Makanaka Hamandishe

ORGANIZATION & ROLE

Future Interns

Data and Science Analytics Task 3

DATE OF SUBMISSION

June 2026

1. Conversion Rates at Each Stage

An extensive analysis of the cumulative data tracks within the structural framework reveals critical insights into user engagement and macro-level transitions. By segmenting the cohort into upper-funnel initial touchpoints and final outcomes, we observe a substantial drop-off between initial contact and actual product adoption.

The customer breakdown yields the following structural counts across the user lifecycle:

Funnel Segment	User Count	% of Total Cohort	Stage Description
Total Contacts (Upper Funnel)	45,211 users	100.0%	Initial marketing outreach and target audience acquisition.
Non-Conversions ("No" Response)	39,922 users	88.3%	Prospects who disengaged or explicitly rejected the pitch.
Conversions ("Yes" Response)	5,289 users	11.7%	Successful subscriptions and completed conversion actions.

Overall Conversion Rate Formula:

$$\text{Overall Conversion Rate} = 5{,}289 / 45{,}211 \approx 11.7\%$$

This baseline conversion rate indicates that while the top-of-funnel reach is broad, the mid-to-lower funnel mechanics require substantial optimization to minimize waste and maximize ROI.

Visual Funnel Representation

Total Contacts: 45,211 (100%)

↓ 88.3% Drop-off Rate

Conversions: 5,289 (11.7%)

2. Key Drop-off Insights

Pinpointing the exact mechanisms behind customer attrition is critical for restructuring our conversion framework. A deep dive into user behavior and demographic filters reveals three distinct bottlenecks where the funnel suffers significant leakages.

The 88.3% Black Hole

The most prominent and severe vulnerability in our current framework occurs immediately following the primary pitch segment. A staggering **88.3% of the target cohort** completely fails to proceed from initial communication to subscription. This suggests a disconnect between upper-funnel expectations and the value proposition presented during the primary pitch. This "Black Hole" indicates that the messaging may be overly generic or failing to capture the core needs of the audience at the exact moment of decision-making.

The Housing Liability Friction

Data cross-tabulation demonstrates that prospects with active **housing loans** exhibit a significantly lower conversion rate compared to the baseline. This structural leak highlights a critical friction point caused by pre-existing financial commitments. When a lead is burdened with heavy long-term liabilities like a mortgage, their disposable income and financial risk tolerance drop. The current pitch fails to address these specific liquidity and cash-flow anxieties, leading to high drop-offs among this high-potential segment.

Seasonal Outreach Inefficiency (The May Spike)

Funnel traffic data indicates that outreach volume spikes dramatically during the month of **May**. However, this aggressive expansion coincides with a sharp contraction in conversion efficiency.

> **Inversion of Volume vs. Efficiency:**
> While May generates the highest quantity of upper-funnel contacts, it yields an extremely low rate of proportional engagement. This indicates diminishing returns due to campaign oversaturation, poor lead selection during high-volume periods, or seasonal fatigue among prospects.

3. Actionable Recommendations

To patch the identified leaks and enhance overall conversion velocity, we recommend the immediate deployment of a three-pronged strategic framework:

- **Target Non-Housing Leads First:** Implement structural filters in our CRM to identify and prioritize leads without active housing loans. By focusing initial sales energy and marketing spend on prospects with higher disposable cash flow, we can rapidly optimize team resource allocation, reduce upper-funnel fatigue, and increase short-term conversion yields.
- **Redistribute Volume From May:** Smooth out the seasonal volatility by reallocating marketing budgets and contact schedules away from the oversaturated month of May. Spreading outreach efforts more evenly across historically high-performing months will stabilize mid-funnel conversion baselines and prevent lead burnout.
- **Optimize Product Positioning for Liabilities:** For prospects identified as holding active housing liabilities, the sales and marketing messaging must be completely reframed. Instead of standard product pitches, emphasize messaging centered on **financial safety, liquidity preservation, and long-term cost benefits** to actively mitigate friction.

Strategic Implementation Matrix

Strategic Initiative	Primary Focus	Impact Level	Timeline
Lead Filtering Implementation	Prioritize non-housing loan leads	**High**	Immediate (Week 1-2)
Seasonal Volume Smoothing	Redistribute May campaign budget	**Medium**	Next Quarter Planning
Value Proposition Overhaul	Tailor pitch for asset/liability mitigation	**High**	Ongoing (Month 1)

Report prepared for evaluation under the Future Interns program framework. All data metrics validated against baseline funnel logs.
